⁺Quick Guide

EE660 - Low Air Velocity Sensor with RS485 Interface

E+E

— your partner in sensor technology.

> **ℹ️ PLEASE NOTE**
>
> Find this document and further product information on our website at www.epluse.com/ee660.

Electrical Connection

> **⚠️ WARNING**
>
> Incorrect installation, wiring or power supply may cause overheating and therefore personal injuries or damage to property.
> For correct cabling of the device, always observe the presented wiring diagram for the product version used.
> The manufacturer cannot be held responsible for personal injuries or damage to property as a result of incorrect handling, installation, wiring, power supply and maintenance of the device.

Hardware

The bus termination shall be realized with 120 Ω resistor using the switch on the electronics board.

> **NOTICE**
>
> Improper handling of the device may result in its damage.
>
> ▪ The power supply must be strong enough to ensure supply voltage within the specified range (see technical data) at any time and at all devices in the bus. This is particularly relevant when using long and thin cables as those can cause high voltage drop. Please note that a single EE660 requires peak current of 150 mA.
Wiring

Digital interface

S1: Response time t_{90} - ON: slow / OFF: fast
S2: Termination resistor - 120 Ω ON/OFF
Address Setting

Address Switch

Address setting via PCS10 Product Configuration Software
All DIP switches at position 0 → address has to be set via PCS10.
Modbus (slave device): factory setting 65 (permitted values: 1…247).
BACnet (master device): factory setting 65 (permitted values: 0…127).
Example: Address is set via configuration software = factory setting.

Address setting via DIP switch
Modbus (slave device): Setting the DIP switches to any other address than 0, overrules the Modbus address set via PCS10 (permitted values: 1…247).
BACnet (master device): Setting the DIP switches to any other address than 0, overrules the BACnet address set via configuration software.
BACnet Note: permitted values are 0…127. The 8th bit of the DIP switches is ignored.
(ID 127 = 0111 111). To set address 0 via DIP switches, the 8th bit shall be set to 1
(ID 0 = 1000 0000). Example: Address set to 11 (= 0000 1011 binary).

BACnet Setup

Please refer to PICS (Product Implementation Conformance Statement), available on www.epluse.com/ee660.

Modbus Setup

FLOAT32

Parameter	Unit[1]	Register number[2] [DEC]	Register address[3] [HEX]
Read register: function code 0x03 / 0x04			
Temperature	°C	1003	3EA
Temperature	°F	1005	3EC
Air velocity	m/s	1041	410
Air velocity	ft/min	1043	412

INT16

Parameter	Unit[1]	Scale[4]	Register number[2] [DEC]	Register address[3] [HEX]
Read register: function code 0x03 / 0x04				
Temperature	°C	100	4002	FA1
Temperature	°F	50	4003	FA2
Air velocity	m/s	100	4021	FB4
Air velocity	ft/min	1	4022	FB5

1) The choice of measurement units (metric or non-metric) must be done according to the ordering guide, refer to EE660 datasheet.
Switching from metric to non-metric or vice versa by using the PCS10 is not possible.
2) Register number (decimal) starts from 1.   3) Register address (hexadecimal) starts from 0.
4) Examples: For scale 100, the reading of 2550 means a value of 25.5. For scale 50, the reading of 2550 means a value of 51.

Communication settings (INT16)

Parameter	Register number[1] [Dec]	Register address[2] [Hex]	Size[3]
Write register: function code 0x06			
Modbus address[4][5]	1	00	1
Modbus protocol settings[4]	2	01	1

Device information (INT16)

Parameter	Register number[1] [Dec]	Register address[2] [Hex]	Size[3]
Read register: function code 0x03/0x04			
Serial number (as ASCII)	1	00	8
Firmware version	9	08	1
Sensor name (as ASCII)	10	09	8

1) Register number starts from 1.   2) Protocol address starts from 0.   3) Number of registers.
4) For Modbus address and protocol settings refer to Application Note Modbus AN0103 (available at www.epluse.com/ee660).
5) If the ID is set via DIP-Switch the response will be NAK.
EE660 - Low Air Velocity Sensor with Analogue Output

Wiring
Voltage output 0-10 V

Remote probe

|	
b	b ... brown
g	g ... green
y	y ... yellow
w	w ... white
s	s ... black
Current output 4-20 mA

Jumper Settings

For performing the EE660 settings via the PCS10 Product Configuration Software (free download from www.epluse.com/pcs10) the jumper for the measuring range must be set to HI.

Selection of response time t90

Jumper t90 SLOW 4 s (factory setting)	no jumper FAST 1 s

Selection of the measuring range

Jumper HI 0...2 m/s (0...400 ft/min) (factory setting)	Jumper MED 0...1.5 m/s (0...300 ft/min)	no jumper 0...1 m/s (0...200 ft/min)
